Why container elements?

Container elements **structure and group** other components in the [layout](#).

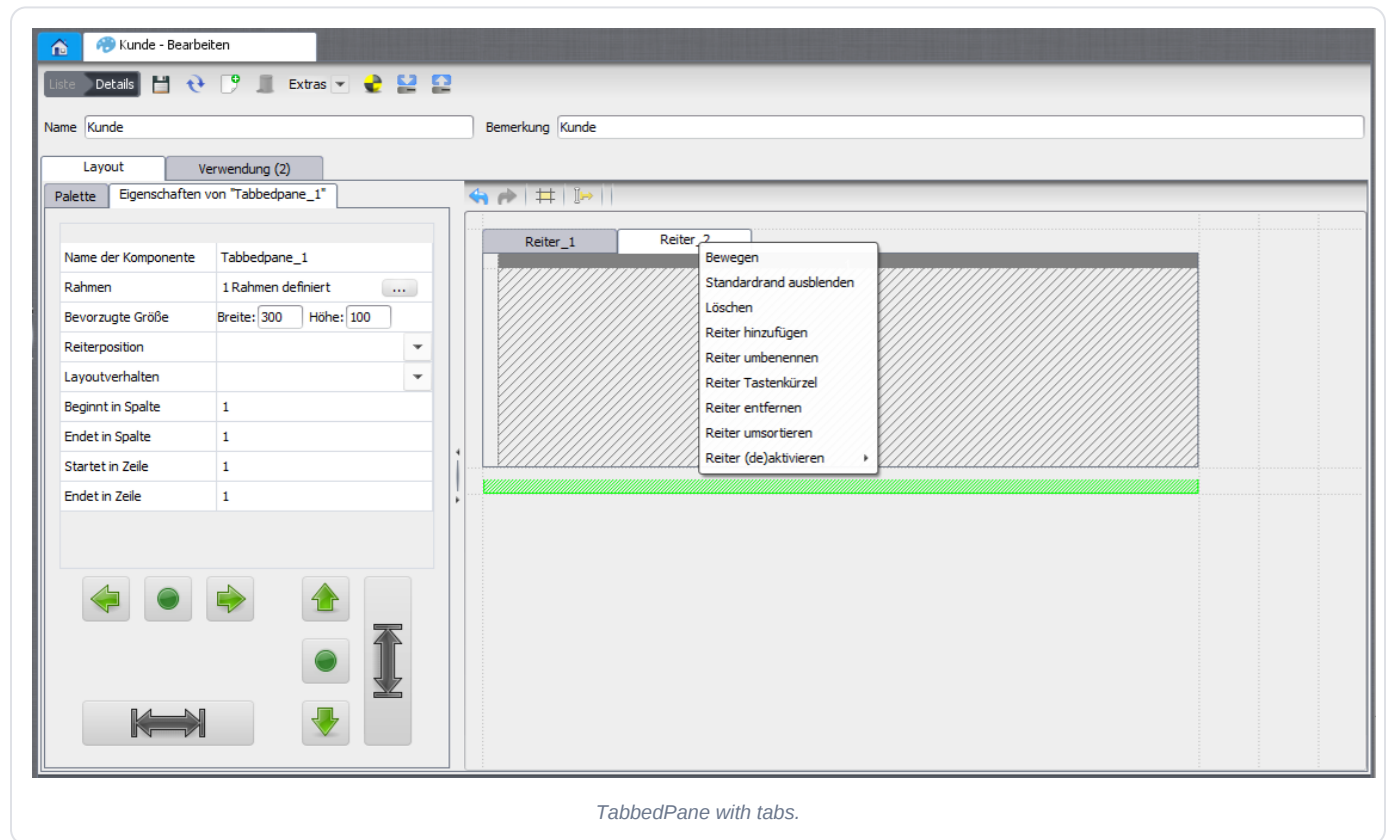

Layout panel

A panel holds its own rows and columns. A new panel is initially „(untitled)“; via the **Border** property (border editor) you set border type and title (incl. translation).

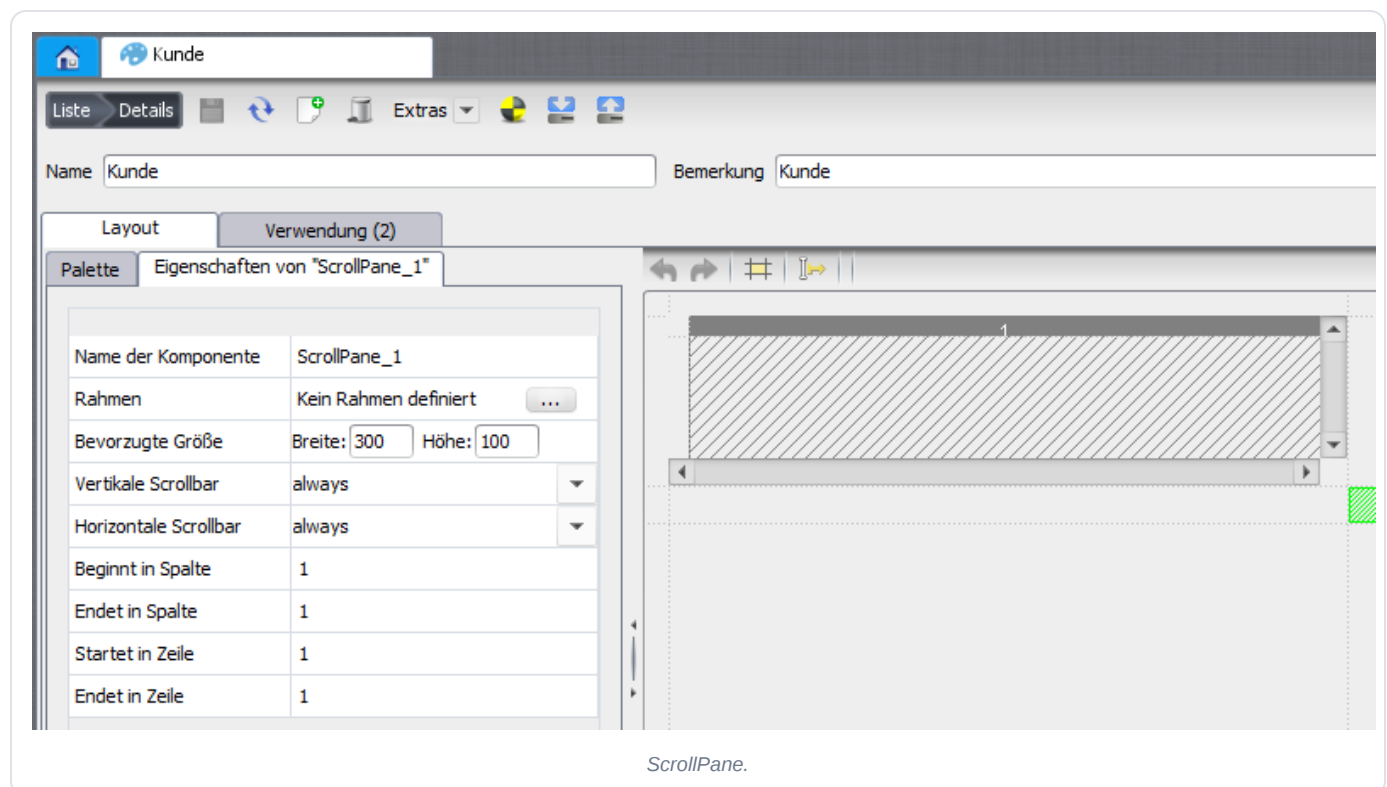

TabbedPane

A panel with multiple **tabs** – ideal for fitting a lot of content (often subforms) into little space. Right-click a tab: add, rename, keyboard shortcut, remove, reorder, (de)activate. Tab position: top (default), bottom, left, right.

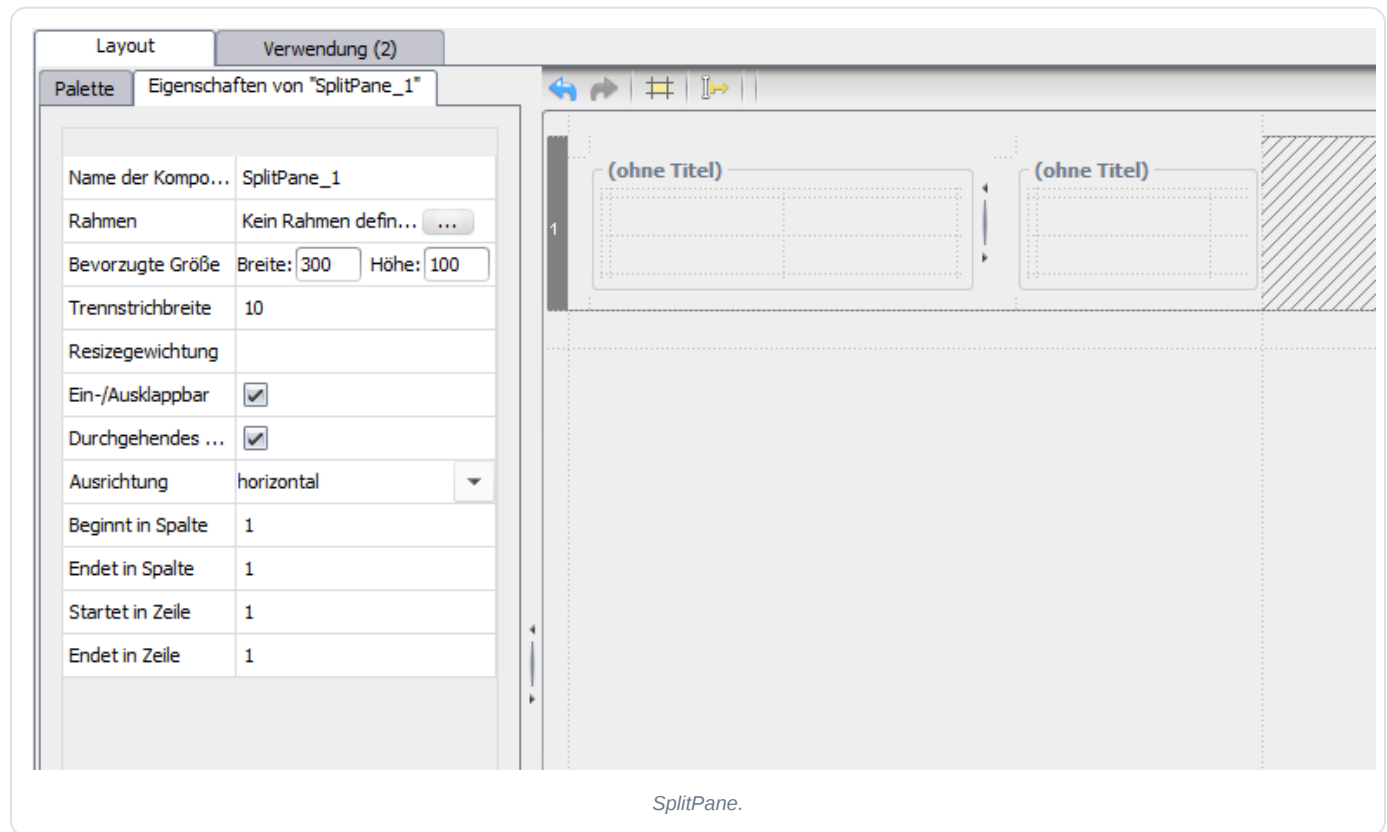

ScrollPane

Allows arbitrarily large content. Vertical/horizontal scrollbar with always, asneeded (only when needed) or never.

SplitPane

Splits the space via a movable divider. Properties: divider width, resize weight, collapsible, continuous layout (live preview while dragging).
