What is multi-select?

Comboboxes with the **multi-select** option allow selecting several values; each value is preceded by a checkbox.

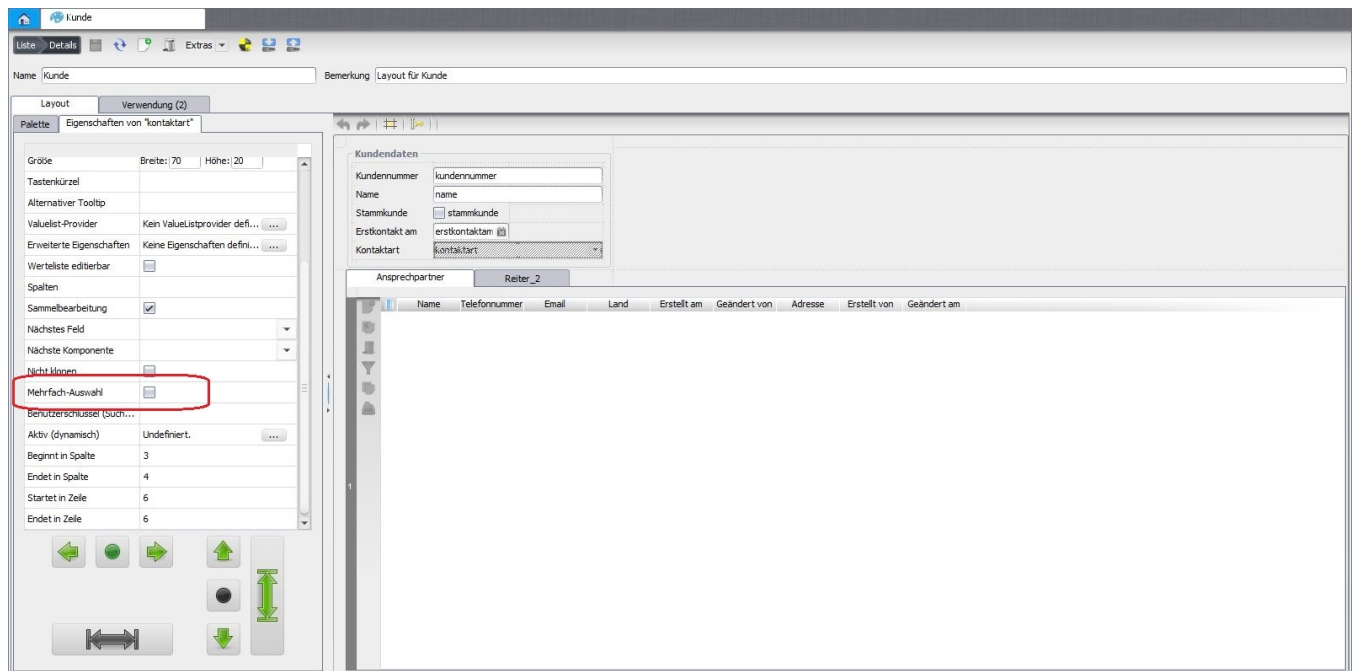

Search masks only

Multi-select only works in **search masks**.

Configuration

Enable the **multi-select** checkbox in the combobox properties.

Multi-select in the search mask.

Usage

The top entry plus the count of further selections is shown. On search the entries are combined with **OR**; the combobox no longer closes automatically.

Effect on value list providers

Since a parameter can now hold several values, use `IN/NOT IN` in the SQL:

```
AUSDRUCK IN $param  
AUSDRUCK NOT IN $param
```

instead of

```
AUSDRUCK = $param  
AUSDRUCK <> $param
```

`IN/NOT IN` also works for single-value parameters.
