References to other nuclets

The first configurable interface is **reference fields to business objects in other nuclets**. Example: a warehouse nuclet requires „customer“ and „article“ but does not contain them itself.

Approach: use the **business object wizard** to **redirect** the warehouse BOs' reference fields from the dummy BO to your own, real BOs (customer, article). On a later nuclet update the import detects the redirected spots and leaves them unchanged.

Planned: API interfaces

In future, **rules** will also be able to use or require objects from other nuclets without knowing them in advance – enabling generic nuclets.

Integration tool

The **relation editor** supports redirecting reference fields visually via drag & drop.
