Menu *Administration Parameter* (rich client) or *gear Parameter* (web client). System parameters control the behaviour of the server and clients. They are grouped by area of use:

Group	Purpose
Anonymous access & self-registration	anonymous user access, self-registration, double opt-in e-mails, valid user names.
Frontend	colors, thumbnail sizes, planning-board limits.
Web client	custom CSS, base URL, document title, mandatory-field marker, content disposition.
Business tests	rollback behaviour for automated business tests.
General	encryption, encodings, query/read timeouts, caching, code generator, e-mail/localization tuning, privacy cleanup, cluster messages, and more.
Nuclet parameters	per-nuclet settings such as Groovy-rule restrictions, classpath extensions, SQL config filters.

When they take effect

Most parameters take effect after saving; some (e.g. client heap, font) only after a **restart** of the server or client. Version notes („from Nuclos ...“) are given at each parameter.

Complete list

The exhaustive, per-parameter reference (names, descriptions, default values and version notes) is maintained in the German page [Parameter](#). Parameter names are identical in both languages.
