Editing records

The generic detail view: layout, type-specific inputs, reference fields, status changes and local hide/show of fields.

REFERENZ

USER

UPDATED: JUL 2026

APPLIES TO NUCLOS APP 1.0

On this page

- [Edit fields](#)
- [Reference fields \(LOV\)](#)
- [Status change](#)
- [Hide and show fields](#)
- [Saving & server actions](#)
- [Unsaved changes](#)
- [Related pages](#)

The detail view renders the server-computed **layout** generically: the desktop grid is re-flowed into a single-column mobile form. Unknown components are skipped so the screen never breaks.

Edit fields

- Scalar fields are edited with **type-specific inputs** (text, number, date, yes/no ...).
- **Read-only/disabled** fields and rights are honoured.
- **Mandatory fields** are validated before saving.
- Values containing HTML are rendered richly; e-mail, phone and web values are tappable.

Reference fields (LOV)

Reference and combobox fields open a mobile **picker** with a server-side quick search (mirroring the Web Client's quick search).

Status change

Below the record title the app shows the **workflow status**. Use the action menu to run the configured **next states**.

Hide and show fields

By **long-pressing** a field you can hide it or bring it back. This adjustment is stored **on the device only** and applies wherever the field appears (detail, subform card, subform record).

Saving & server actions

On **save** – and after rule execution, status change, generation or print – the server may return **follow-up actions** that the app runs like the Web Client: show a **message**, **navigate to a record or a (filtered) list**, open an **external URL** or **end the session** (forced logout/login).

Unsaved changes

If you leave a record with unsaved changes, the app asks: **keep editing**, **save** or **discard** – so input is never lost by accident. This also applies to subform editors.

Subforms

Subforms appear as their own cards – see [Subforms](#).
