Machine-translated – under review

This page was machine-translated from German as a first draft and is currently under review. The authoritative source remains the **German original** (see the language switch above).

4.3.1 Setting up an input directory

- Set up a file directory for the input of the MT940 files. The directory should be located on the server on which Nuclos is installed.
- The directories "success" and "failure" must be created as subdirectories.
- Read and write access to these directories must be ensured for the Nuclos service.

The subdirectories "success" and "failure" are used to store the processed MT940 files. Successfully processed files are moved to the "success" subdirectory, files that cannot be processed end up in the "failure" subdirectory.
