💡 Print profile

Control the print process – output formats, rule entry points and FIFO printer spooling.

Print profiles bundle the **output formats** offered when printing and can be configured individually by the user. Two additional **rule entry points** allow influencing the print process.

Influence via rules

- **Tailor** the print profiles and output formats offered to the user on *Print* depending on the record.
- **Post-process** documents printed by the user (e.g. hand them to a document management system).

Printer spooling

Nucleos manages print jobs via its own **spooling**: each printer has a worker with a list of `PrintResult` objects processed in **insertion order (FIFO)**.

Example

Example: a user selects five documents – three for the label printer, two for the standard printer. The server groups the jobs by target printer (dispatching) and passes them to the respective worker as a batch. This way a large print job does not block the entire spooling.
