QR codes in reporting

QR codes can be used via the **image element** in JasperReports – and thus in Nuclos (e.g. for the GiroCode/EPC QR code).

Prerequisites

- Jaspersoft Studio
- ZXing Core
- ZXing Java SE Extensions

Procedure

Add the ZXing libraries in Jaspersoft Studio as external JARs via the project properties. Then insert an **image** element and set the QR generator in its *image expression* (field from the data source, here `$F{ZEICHENKETTE}`; width/height via `encode( . . . )`):

```
com.google.zxing.client.j2se.MatrixToImageWriter.toBufferedImage(  
    new com.google.zxing.qrcode.QRCodeWriter().encode(  
        $F{ZEICHENKETTE},  
        com.google.zxing.BarcodeFormat.QR_CODE, 300, 300))
```

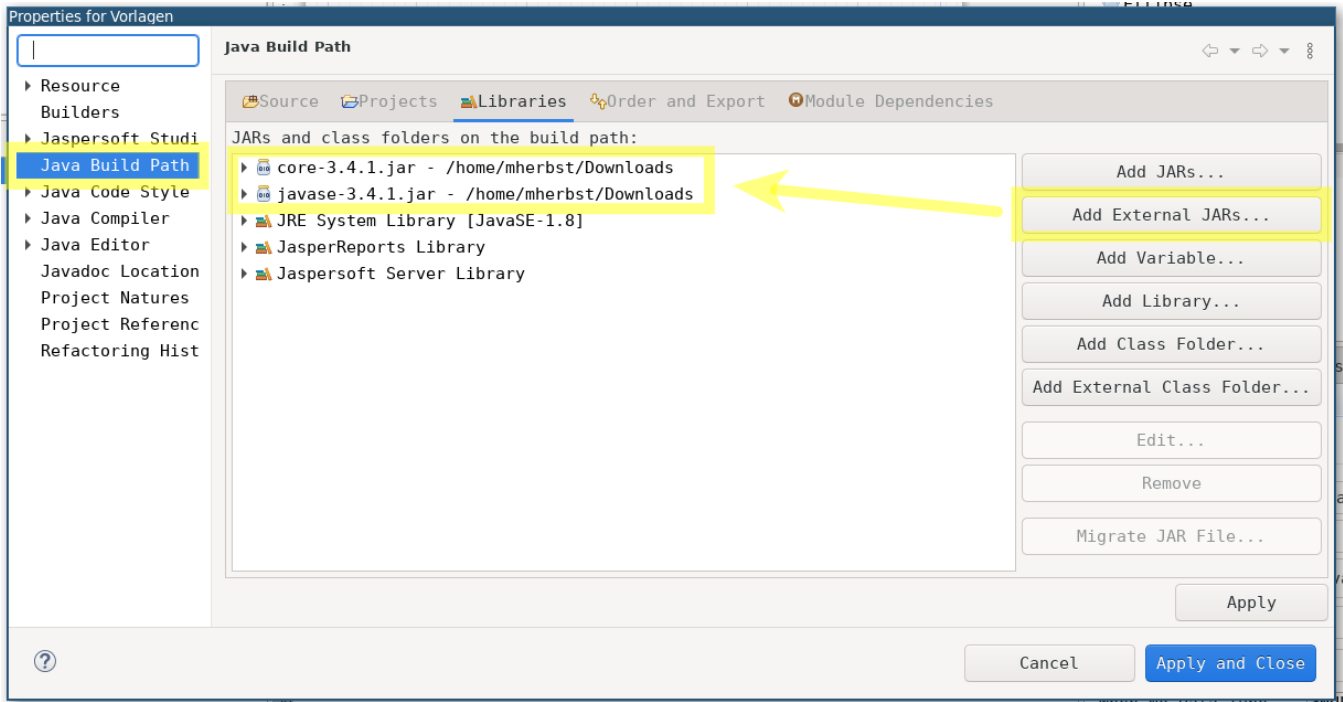

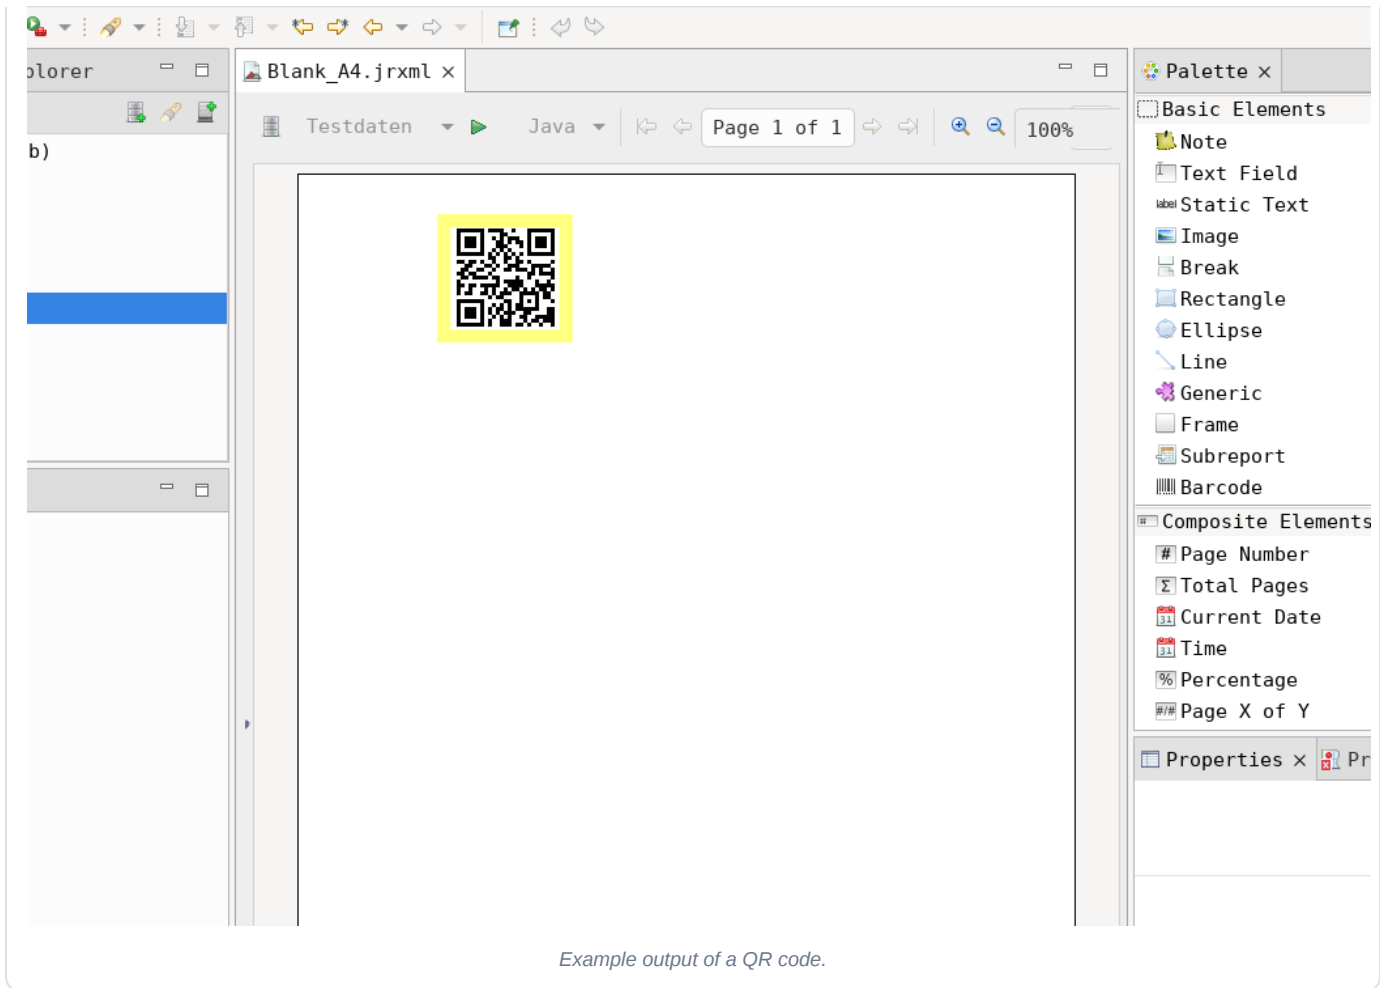

Image expression with the QR generator.

Important

Before uploading, set the **expression class** = `java.awt.Image` – otherwise the server aborts the upload with an error. To use it in Nuclos, transfer the libraries as [extensions](#).
