File names for reports & forms

Under *Configuration Report Report or Form* the finished .jrxml files are added. Without an explicit file name the output PDF gets the name of the report /form plus **date and time**.

Assign a custom file name

The *output formats* tab has a **file name** column. The name given there is always combined with date/time. Additionally you can use **fields from the data source** – in curly braces: `${field name or alias}`. Many combinations are possible.

File name with data source fields.
