PostgreSQL connection in the designer

To work with real data in the Jaspersoft designer, set up a connection to the database. Besides PostgreSQL, XML, CSV and other DBMS are possible (load drivers if needed).

Steps

1. Open *New Data Adapter*.
2. Add a new connection in the overview dialog.
3. Choose the connection type **Database JDBC connection**.
4. Enter the connection data: name, driver (PostgreSQL), host/port/database name, DB user and password.
5. **Test** the connection – save on success; it is then available for selection.

JDBC connection data.
