The Web Client can open links via hyperlink fields. For security reasons modern browsers block links to local files (file protocol). Below is the setup for **Windows + Firefox**.

Example

Example: c:\Users\foo\bar.csv is opened as file:///c:/Users/foo/bar.csv.

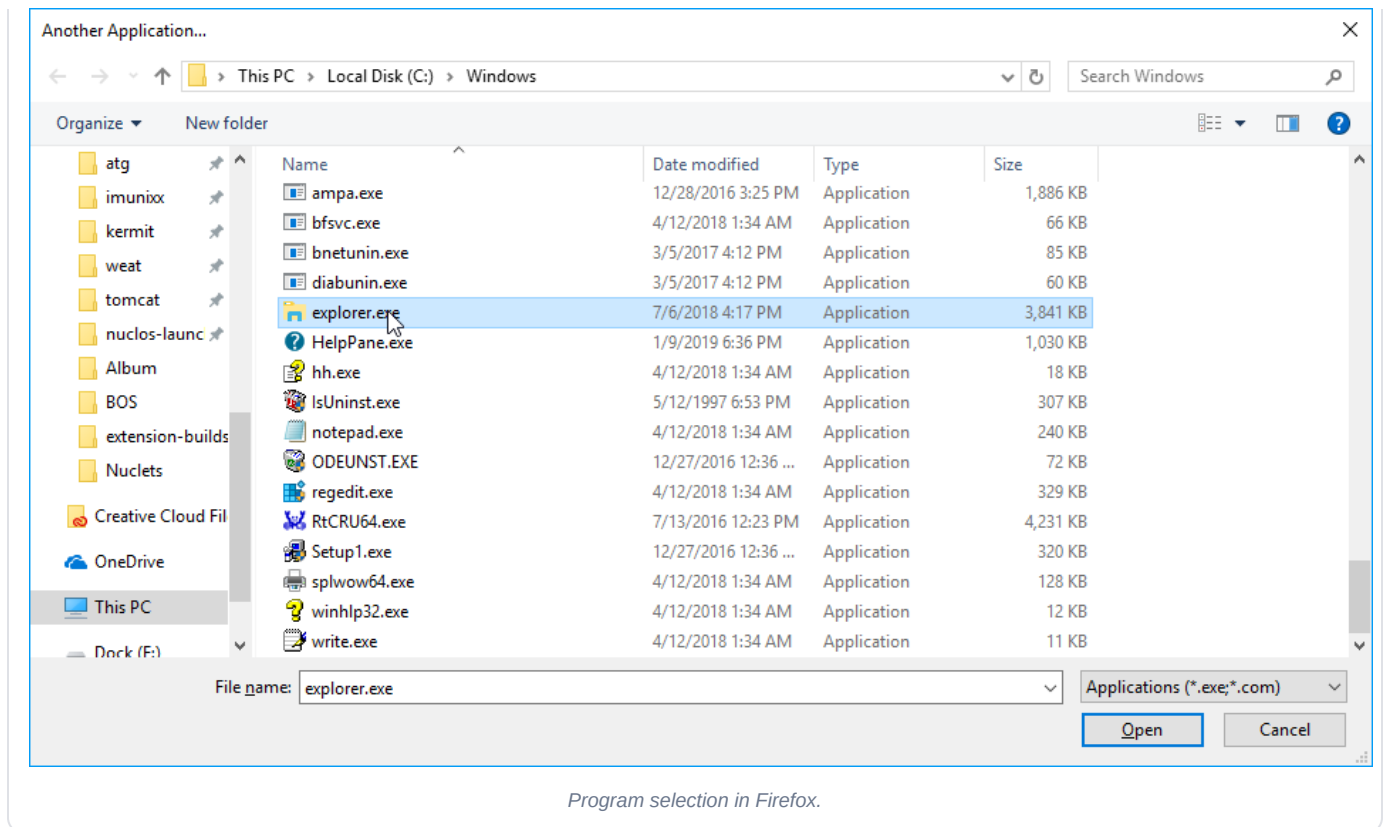

Firefox security settings

In the profile directory (%appdata%\Mozilla\Firefox\Profiles\{profileId}) create or extend user.js:

```
user_pref("capability.policy.policynames", "localfilelinks");
// mit Leerzeichen getrennte Liste der Hosts (mit Port)
user_pref("capability.policy.localfilelinks.sites", "http://localhost:8120");
user_pref("capability.policy.localfilelinks.checkloaduri.enabled", "allAccess");
// schaltet den Firefox-eigenen Handler fuer das Protokoll "file" aus
user_pref("network.protocol-handler.expose.file", false);
```

Choose the default program

On the first click of a file link, Firefox asks for a program – choose Windows Explorer (c:\Windows\explorer.exe) and enable „Remember my choice for file links“.

Afterwards each click on a local link opens Explorer directly.
