

Backup

🌐 Language: [Deutsch](#) · [English](#)

🔧 Backup

Back up the database and application – save BLOBs correctly, recommended methods and testing the restore.

HOW-TO

ADMINISTRATOR

UPDATED: JUL 2026

APPLIES TO NUCLOS 4.2026.X

On this page

- [Database backup](#)
- [Recommended methods \(PostgreSQL\)](#)
- [Test the restore](#)
- [Related pages](#)

A backup should go without saying – both the **database** and the **application** (which holds document attachments, among others) must be backed up.

Database backup

It is crucial that **BLOBs** are saved correctly. BLOBs contain, among others:

- header for checking the database version (GZIP binary)
- image components
- state model layouts

BLOBs are critical

If BLOBs are not saved correctly, a restore is **not** possible – the backup is then useless.

Recommended methods (PostgreSQL)

- [pg_dump via console/script](#) (recommended, scriptable)
- [backup via pgAdmin \(GUI\)](#)

Beware Navicat/Linux

The database front-end *Navicat Premium* saves BLOBs incorrectly on **Linux** (bug) – such backups are unusable. The macOS version works correctly.

Test the restore

Test every backup method with an actual restore – only then is it guaranteed that the backup can be applied correctly.
