Common errors during Nuclos development in the IDE and how to fix them.

When compiling

Error	Fix
ajc: The import org.nuclos.schema.* cannot be resolved	<i>nuclos-schema Maven Generate Sources and Update Folders.</i>
ajc: * cannot be resolved to a type	<i>nuclos Maven Reimport.</i>

When starting the server

BeanCreationException ... A universal match pattern ('/**') is defined before other patterns ...: run `mvn clean` in the terminal.

 **war as a module**
For `mvn clean` to take effect, the `war` must be listed as a module in the `pom.xml`. This is given for the Nuclos core; for extension projects you may need to add it.

When starting the client

Error creating bean 'internalAspectJWeavingEnabler' ... (form freezes after login): place the `spring-instrument-*.jar` somewhere and reference it in the client configuration under **VM arguments**.

Runtime

Unexpected `NullPointerException` (e.g. on `@Autowired` fields): Nuclos needs the **AspectJ compiler**. Make sure `Ajc` is active in the Maven import.
